

A **botanical garden** is a public or private garden where different species of plants are cultivated, with the objective of their collection, conservation and also to be displayed to the public, for education or tourism.

The gardener prepares the soil, sows and plants the seasonal species or any new species of the garden, both outdoors and in greenhouses.

He also takes care of the periodic maintenance of the green, with activities such as pruning, irrigation or other interventions and if plant pathologies are identified, he provides to the necessary care treatments.

GEOclimHOME Pro Geoheritage and climate change for highlighting the professional perspective

Also the **tourist guides** can work in the gardens, with tourists and schools.

During the project we especially spoke with the gardeners of the Gardens of Villa Taranto; thanks to them it was possible to know better about the damages caused to ancient trees by violent storms in the last years and the management of the gardens in order to face future similar events

Their experience and point view provides really of interesting information for wide discussion а on climate change.
